

CMPE 273 – Lab2 – Yelp Recreation

Name: Bhavana Bangalore Sathyaprakash

Id: 014597245

GitHub Code Link: <https://github.com/BhavanaBS/CMPE273-Lab2>

YouTube Video Link: https://youtu.be/_Z5xma-sWZM

Introduction:

The goals the system includes the development and functional re-creation of Yelp. Yelp allows customers and restaurants to place and receive food orders.

Personas in Yelp:

- 1 Customer
- 2 Restaurant

A customer can create his profile with details such as profile picture, address, etc. It also allows him to search dishes available at various restaurants based on the filters of location, food deliver option and order them if he chooses to. He can also browse through various events, or search for a particular event, hosted by the restaurants and register to the ones he likes. The customer is also able to see other customer profiles and follow the ones he wants. Previous orders and order statuses are some of the other functionalities available to him.

A restaurant can create its profile with details of location, timings etc. It can also add the details of various dishes available and accept or reject orders it receives. The restaurant can also post the events it plans to host and have a look at the participant details. A complete list of orders and events for a restaurant are also maintained. The restaurant can initiate a chat with its customers in case the need arises.

System Architecture and Design:

The system is built using the below mentioned technologies:

- 1 Frontend:

The front-end of the system is built using React Redux to help in interaction between various components of the application through a single point of thruth. React Bootstrap helps enhance user experience while using the application. Axios calls are made using the middleware Redux Thunk to connect the frontend to the backend of the application.

- 2 Backend:

The back-end part of the application is built using NodeJS. It helps connect the frontend API to MongoDB database by pushing messages into kafka topics. It acts as the producer for kafka. ESLint framework provides the static code analysis.

3 Kafka:

The publish-subscribe based messaging system to exchange data between the application and database with fault tolerance.

4 Database:

The database for the application is a NoSQL database MongoDB. This helps write simple function for database operations.

5 Deployment:

The entire application, i.e., frontend, backend and database are deployed on Amazon AWS EC2 platform.

Update Details

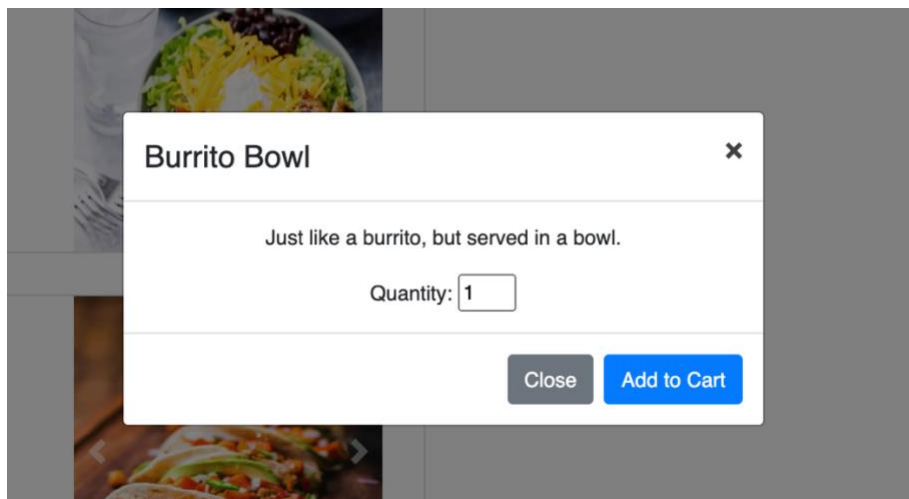

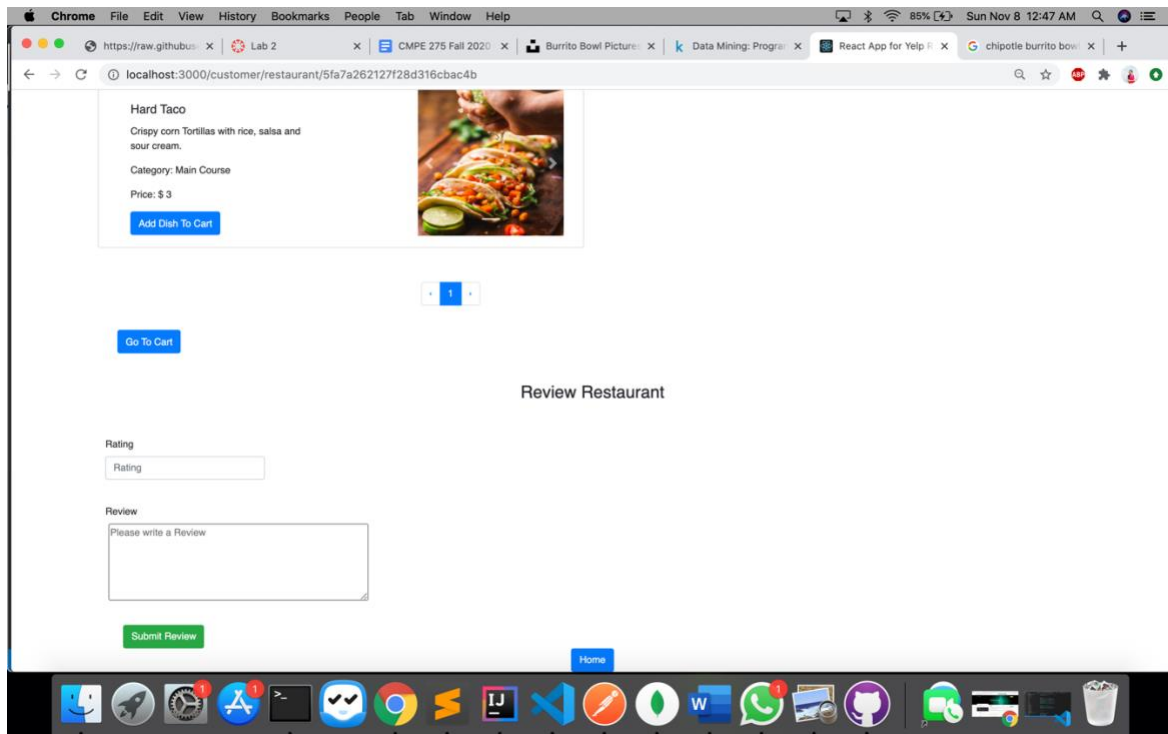

The screenshot shows a web browser window with the address bar displaying "localhost:3000/customer/restaurant/5fa7a262127f28d316cbac4b". The page title is "Chipotle Restaurant Page". It features the Chipotle logo and a table with restaurant details:

Name	Chipotle
Description	Hi. This is Chipotle at Los Gatos
Cuisine	
Location	Los Gatos
Timings	09:00 - 10:30
Phone	2297787449

Below the table is a "Menu" section. The first item is the "Burrito Bowl", described as "Just like a burrito, but served in a bowl.", categorized as "Main Course", and priced at "\$ 6.37". There is an "Add Dish To Cart" button. To the right of the text is an image of a burrito bowl.

The browser's taskbar at the bottom shows various application icons including Finder, Launchpad, System Preferences, App Store, Mail, Safari, Chrome, VS Code, and others.

First Message From Customer

Nov 7, 2020, 11:22:49 AM

Hello Bhavana.

Nov 7, 2020, 8:23:05 PM

Your order is being processed.

Nov 7, 2020, 8:33:05 PM

We will intimate you when it is ready.

Your order is being picked up.
Nov 7, 2020, 8:40:15 PM

Thanks for the update.
Nov 7, 2020, 10:19:22 PM

I got the driver's information.
Nov 7, 2020, 10:21:55 PM

Could you please ask the driver to leave the food on my door step.
Nov 7, 2020, 10:23:58 PM

Thankyou.

Testing Results:

JMeter Testing:

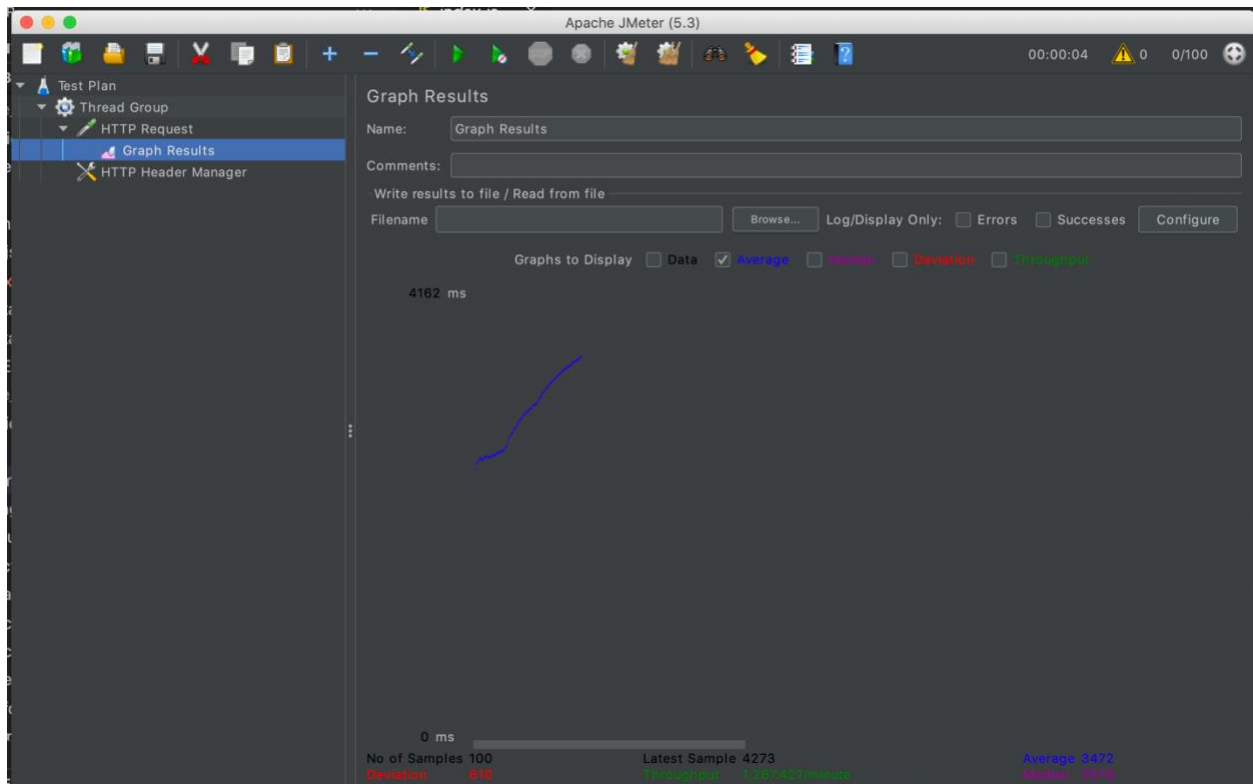

Without connection Pooling:

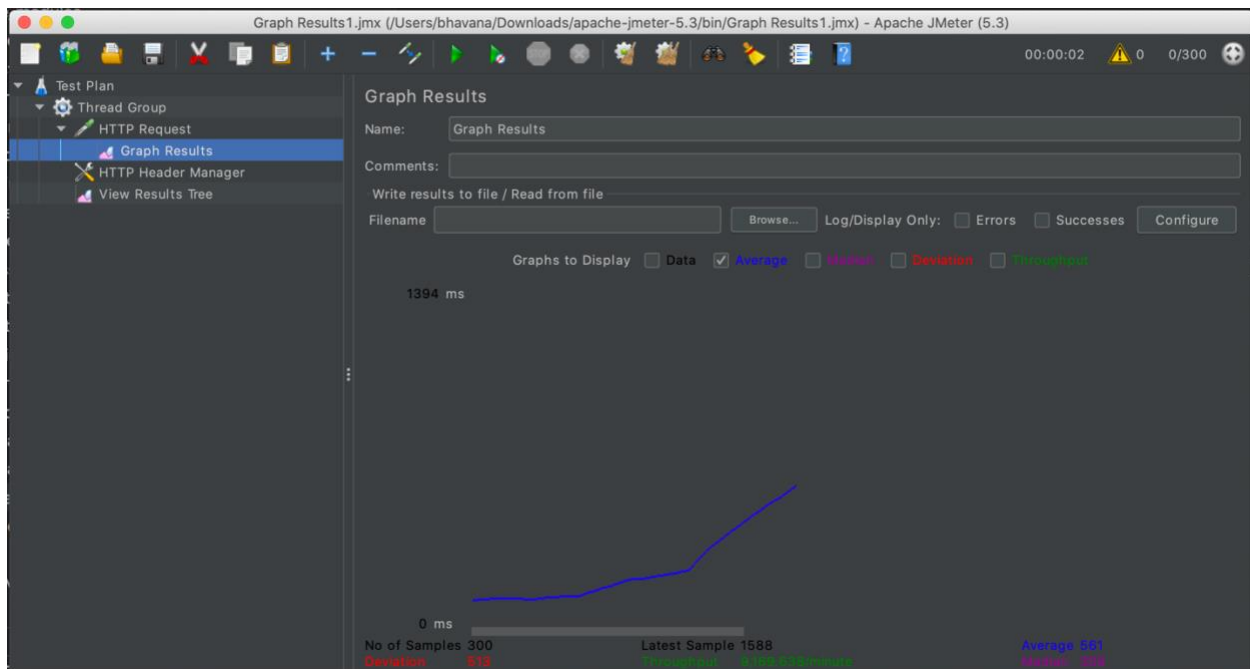

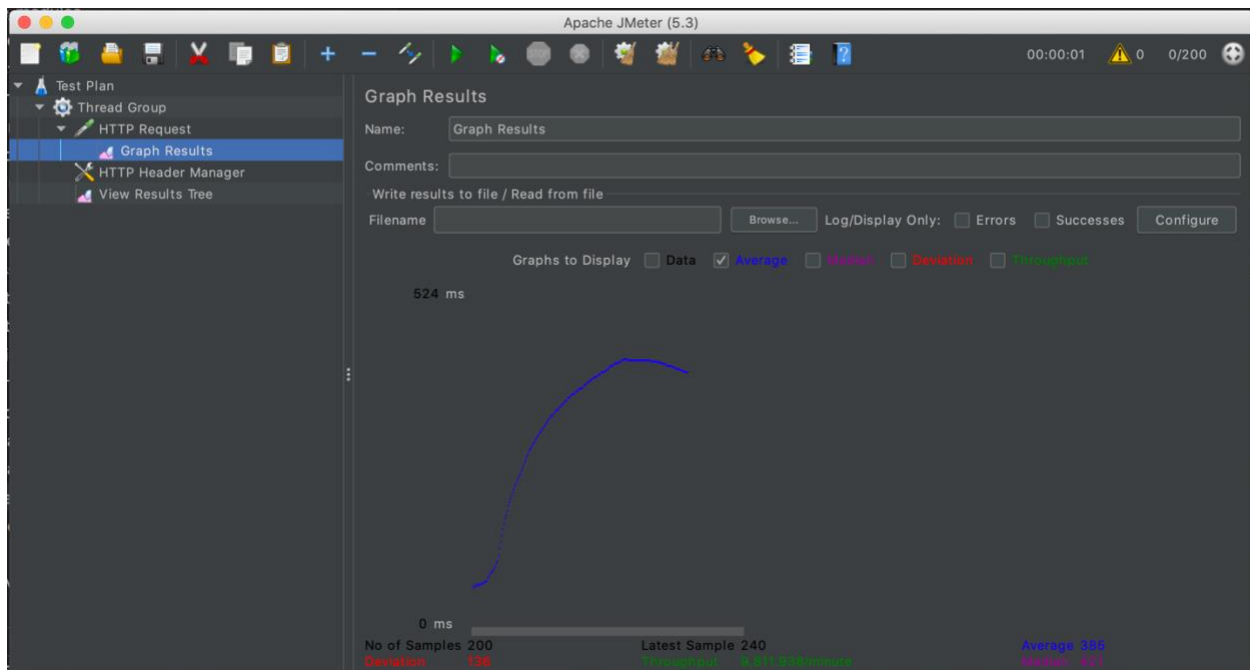

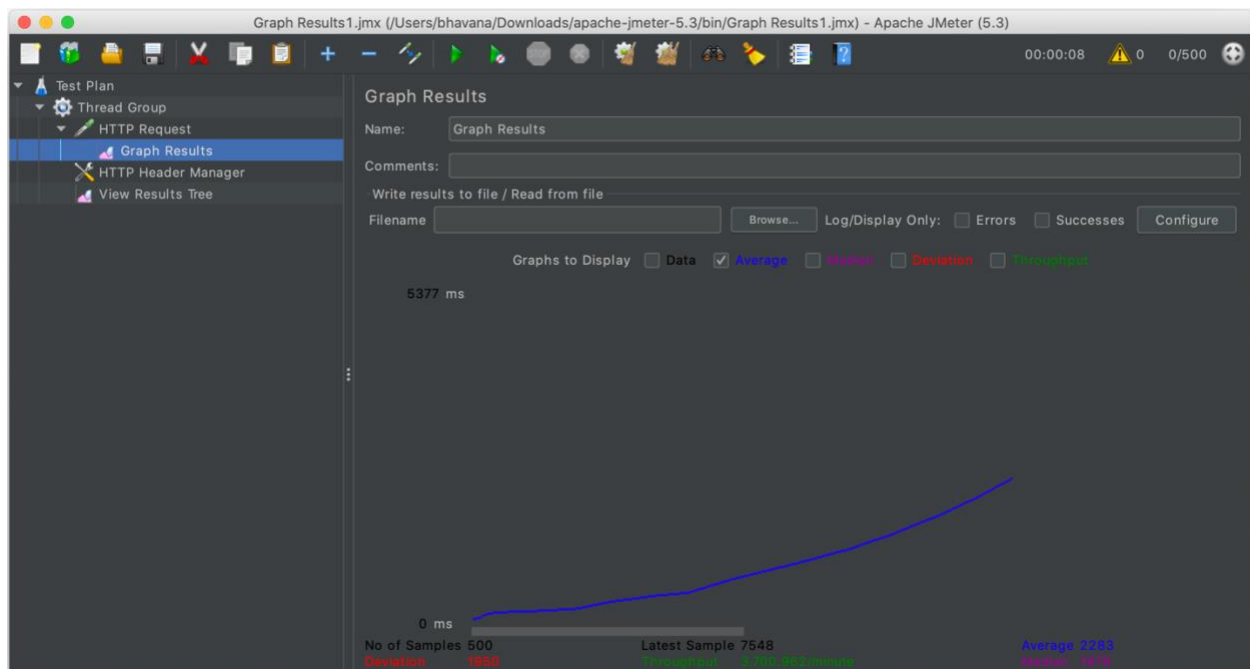

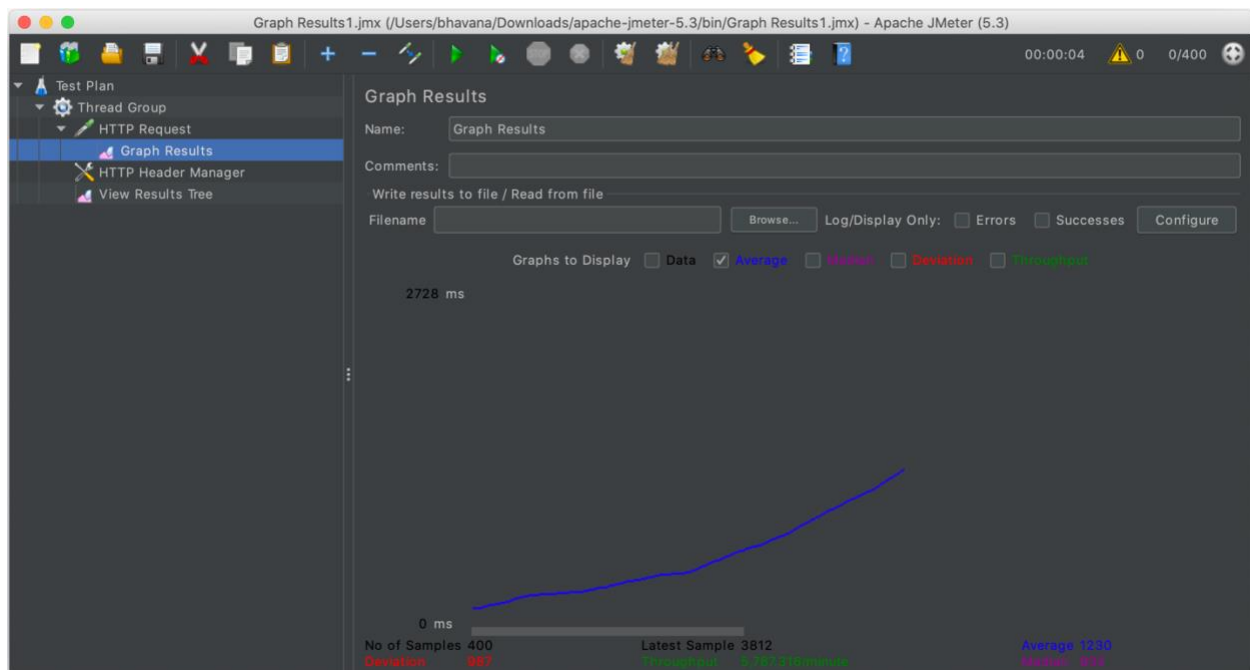

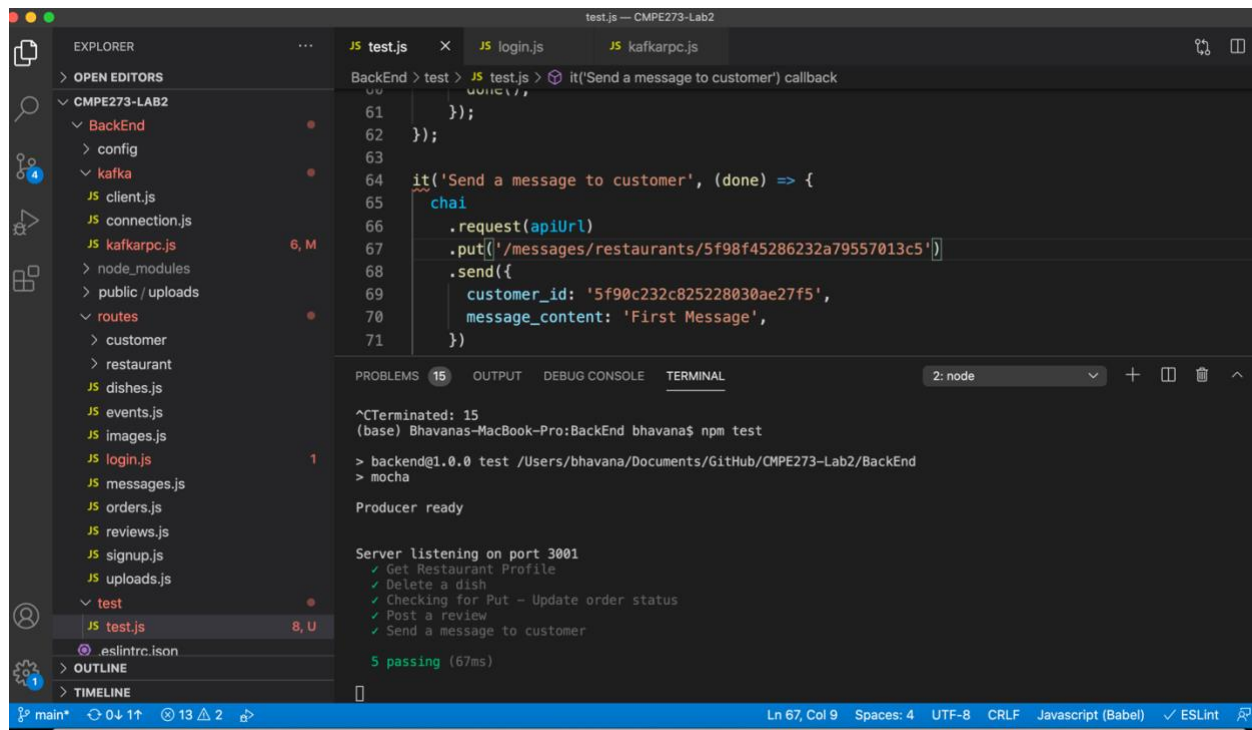

With connection Pooling:

Mocha Testing:

Answers to Questions:

Q 1:

In Lab 1, authentication was performed using cookie in HTTP-Header. Difference between JWT-Passport and cookie in authentication lies in the security. Passport is a session-based strategy for authentication wherein we make use of a session id which is stored in the cookie of the user's browser. The server verifies this session id in the cookie with the database information and carries out the verification process. Also, Passport is more secure as the token is signed for by the user key. Hence there is less change of identity theft. The token has an expiry which helps maintain small and authenticated sessions easier.

Q 2:

Kafka is used as a messaging queuing system, which guarantees that the message is delivered to the client. As a result, it is used as an abstract communication channel between the two systems in a scalable infrastructure. This helps in making the calculation of the request async and different systems can scale and function separately. This also guarantees that when the Kafka client system is down, by queuing the communication messages until the system recovers it provides the required error tolerance to the infrastructure at scale.

Question 3:

SQL implementation is good when the application data is more structured and relational. Like when a customer places an order or registers for an event. Here there is a logical relation between customer, restaurant and orders/ events tables. This relation is difficult to implement using

mongoose in spite of populate option. MySQL join works better in these scenarios. Whereas Mongo DB is efficient when there is unstructured data involved. Like when saving the restaurant profile, some of the attributes like reviews of the restaurant, dishes, images may not always be available. And also, a single fetch call, without join is enough to retrieve all the data required.

Git Commit history:

The screenshot displays the GitHub commit history for the repository `BhavanaBS/CMPE273-Lab2`. The page is organized into sections based on the date of the commits.

Commits on Nov 8, 2020

- Pagination Commit** (BhavanaBS committed 1 hour ago) - Hash: `62e8162`

Commits on Nov 7, 2020
